

## Windows PPC 2003 Software Instructions

### [Download the PPC 2003 tracking software](#)

Save the .CAB file to your desktop PC in a New Folder

### What are the requirements to run the Windows PPC 2003 version?

- Your phone will need an external [Bluetooth GPS receiver](#)
- Your phone should have Bluetooth

### Once you have all the above requirements, follow the steps below.

- [Register an account](#) at LocateA.net, wait for the email to arrive and click the activation link in the email.
- [Log in](#) to LocateA.net using the user name & password you just registered, but do this on your desktop PC, not your mobile.
- You should be presented with a screen asking you to add your **first user**, in this case this will be **you**. The first question asks you which map you want to appear on via a drop down list, click the list and choose one of the maps. Do not worry if you can not find a map that suits you, to test the application list yourself in **UK > People**.
- Complete the form fields marked \*, you can put anything in the boxes, only you see this information because it is your profile.
- Press 'submit'.
- You should now be looking at a page called [My Users](#), which is a short summary of the information you have just submitted. At the moment we are only interested in the **LIVE** column, which should be a red cross like this [ ✖ ]. This tells us that the person you are tracking is **not** showing on the map yet. When its a green tick [ ✔ ] you know your mobile is sending data to our servers and you are showing on the map, but before this can happen we need to set up your mobile phone to send its position to our servers.

### Now we come back to the mobile phone software.

- Tap the start menu in the top left corner of your device to bring up the menu, then tap ' File Explorer ', right at the bottom of the screen you should see 2 options, [ Up ] and [ Menu ]. Keep tapping [ Up ] until it goes gray in colour and you cannot tap it anymore.
- Tap [ My Documents ]
- Tap [ Menu ] at the bottom right of the screen
- Tap [ New Folder ]
- Delete the word [ New Folder ] and replace it with [ LocateA ]
- Connect your PDA to the PC with the Cable it came with, this should auto-start ActiveSync
- Copy the .CAB file from your desktop PC to the folder you just made on your mobile device. [ i.e. My Documents/LocateA ]
- Surf to the folder LocateA you just made in My Documents and tap the .CAB file [ the only file in the list ]
- The software should auto-install on your device
- To run the software tap Start > Programs on the mobile phone, you should see a list of icons, find the LocateA icon and tap it.
- Tap Menu > Server > Login
- Enter the ID number you see on the [My Users](#) page on your desktop PC.
- Enter the PIN number you see on the [My Users](#) page on your desktop PC.
- *these two values are important*, **DO NOT use the username & password you registered for LocateA**
- Select 'OK'

- The software should say 'connecting' and return you to the main LocateA screen

### Pair the mobile phone with the Bluetooth GPS receiver

- On your device, tap the Start Menu
- Tap [ Settings ]
- Tap [ Connections ] at the bottom of the screen
- Tap [ Bluetooth ]
- You should see 2 'tick boxes'
- [ ] Turn on Bluetooth
- [ ] Make this device discoverable to other devices
- **Tick both boxes**
- Tap [ Devices ] at the bottom of the screen
- Tap [ New Partnership ]
- Your device should start scanning for Bluetooth devices that are in range, at this point make sure your Bluetooth GPS Receiver is switched on.
- Tap [ BT GPS ] or [ GPS ] to make it 'gray' (names might differ depending on your make / model of your GPS Receiver)
- Tap [ Next ] Bottom right of the screen
- You may be asked to enter a 'Passkey', this is quite normal for Bluetooth devices, if you have no idea what the key is, it is probably 0000 or 1111.
- Enter the Passkey and Tap [ Next ]
- You should now see a screen that says 'Partnership Settings'
- Where it says 'Select services to use from this device'
- Tick the box that says 'Serial Port' [ **Very Important!** ]
- Tap [ Finish ] Bottom right of screen.
- You now need to set up a 'COM' port for the GPS to use.
- Tap [ COM Ports ]
- Tap [ New Outgoing Port ]
- Tap [ BT GPS ] or [ GPS ]
- Tap [ Next ] Bottom right of screen
- Change the Port to **COM 7 or if this is not available, use any port but make a note of the port number!**
- **Un-Tick** the [ Secure Connection Box ]
- Tap [ Finish ] Bottom right of screen
- That's it!, you have now set up your mobile device to talk with the GPS Receiver over Bluetooth.
- Tap [ OK ] Top right of screen
- Tap [ X ] Top right of screen

### If your mobile phone is using a Bluetooth GPS receiver, follow these points.

- On the main screen, the first thing to do is Tap [ Settings > GPS > Port ]
- If the 'Serial Port' does **not** say [ COM7 ], change it so it does **or change it to the port you made a note of above!**
- Leave the [ Baud rate ] set at 9600
- Tap [ OK ] Top right corner
- If everything is working ok, you should be taken back to the main screen, with a message such as this.
- ' Server: OK '
- ' GPS Fix: OK '
- If you see this, you are on the map!
- Wait a few minutes and then go back to the [My Users](#) page on your desktop PC, refresh the screen by pressing **F5** on your keyboard or click the 'refresh this page' link.

- If the red cross [✘] under the **LIVE** column has changed to a green tick [✔] you are showing on the map, to see the map, click the [📍] icon.
